

# Patient chair for eye examinations

VELA has developed several chairs designed to provide healthcare personnel with optimal working positions during eye examinations. The chairs have been developed based on experiences gained from our many visits to eye clinics, as well as our knowledge of the ergonomic challenges healthcare workers face on a daily basis.

## BENEFITS:

- :: Based upon the need for health care professionals to sit optimally, VELA have made it a priority that a patient's sitting height can be easily adjusted to best suit the seated position of medical staff. This is performed safely and easily using the stepless electric height adjuster.
- :: The chair provides the right conditions for a quick and safe examination. The patient sits securely in the comfortable seat and supportive backrest. Furthermore, the armrests help the patient to remain calm during the exam.
- :: The doctor or technician can easily move a patient while in the chair using the push handle, and it is easy to adjust the patient's position. This saves personnel time before and after the exam.
- :: The patient moves safely and easily in and out of the chair thanks to the brake, seat rotation lock and armrests. This results in a self-reliant patient and less strain on personnel, even when working with patients with reduced mobility.
